

## EDUCATION

**University of California, Los Angeles** 09/2025 – 06/2027  
Master's Applied Statistics and Data Science Los Angeles, CA

- **Applied Regression:** linear/logistic/Poisson regression, regularization (Ridge/Lasso), model diagnostics, and causal inference using R.
- **Mathematical Statistics:** probability theory, estimation (MLE, MoM), hypothesis testing, and confidence intervals — the theoretical foundation behind every model.
- **Data Management:** SQL, relational database design, data wrangling, and ETL workflows for large-scale structured datasets. Advanced Statistical Communication: translating model results into stakeholder-ready insights through visualization (ggplot2) and written reports.

**The University of West London** 09/2019 – 07/2022  
Bachelor of Arts with *FIRST CLASS HONOURS* in Accounting and Finance London, UK

- **Quantitative Methods:** statistical inference, regression analysis, time-series forecasting, and Excel/SPSS-based financial modeling.
- **Corporate Finance & Financial Reporting:** valuation, capital budgeting, DCF modeling, and IFRS-compliant financial statement analysis.
- **Management Accounting & Auditing:** cost analysis, variance decomposition, risk-based audit testing.

## PROFESSIONAL EXPERIENCE

**Chongqing Winter Orange Technology Education Co., Ltd** 04/2022-Present  
*Chief Financial Officer* Chongqing, China

- Co-founded an edtech startup serving 2,000+ users; led a cross-functional analytics workstream applying statistical modeling and machine learning to address course-matching fraud, resource allocation inequality, and tax optimization.
- Built a Random Forest classifier for personalized course recommendation; engineered behavioral features (engagement frequency, session depth, learning-trajectory consistency), tuned hyperparameters via 5-fold cross-validation with grid search, and benchmarked against logistic regression and gradient boosting baselines — achieving 89% accuracy and  $F1 = 0.86$ , reducing mismatched enrollments by 34%.
- Developed a tax-scenario optimization framework combining Lasso regression (for variable selection across 20+ policy-relevant financial features) and Monte Carlo simulation (10,000 iterations) to estimate expected tax liability and 95% confidence intervals under alternative policy combinations; the recommended scheme delivered ¥235,000 in annual savings, 72% of which was reinvested into an AI-driven diagnostic tool.
- Designed a Power BI dashboard integrating cohort retention curves, unit economics, and CAC/LTV decomposition to surface under-performing capital allocations; informed reallocation decisions that lifted profitability by 18% over two quarters.

**Everbright Securities** 10/2023 – 06/2025  
*Investment Bank Division Analyst* Beijing, China

- Independently led the response to working capital and accounts receivable inquiries during the IPO review process. Conducted a systematic analysis of the correlation between accounts receivable movements and revenue growth over the reporting period, leveraging Python to process multi-period financial data and perform customer- and aging-level analyses. Focused on providing sound commercial justifications for long-term outstanding items (>180 days) and the collection structure from the top 10 customers (representing 35.59% of total receivables), supported by industry benchmarking and peer comparison using Bloomberg, based on contract terms and credit policies. Built a logical and closed-loop explanation that effectively supported the company in securing final approval from the listing committee.
- Led a focused analysis on related-party and other receivables transactions, performing a look-through review of other receivables representing approximately 11% of total assets, with particular attention to potential non-operational fund occupation, consolidation of branch entities, and elimination of intra-group balances, and contributed to the preparation of remediation and compliance documentation in support of regulatory inquiries and internal review processes.
- Analyzed the recoverability of deferred tax assets totaling approximately RMB 50 million, with a focus on the alignment between deductible temporary differences and forecasted taxable profits, and assisted in identifying potential tax risk exposures and developing corresponding disclosure and mitigation strategies.

**Ernst & Young** 10/2022 – 09/2023  
*Assurance Staff* Beijing, China

- Led a sizeable IPO project and be responsible for the money funds in auditing job and completed confirmation letters to banks to verify account balances (over 1000 letters to 124 subgroups) and dealt with unusual contractual terms and transactions.
- Established a tool using VBA achieving fast and accurate alignment on book balance and executed substantive quarterly and annual testing (including journal entry, accounts receivable, and revenue), utilizing advanced Excel analysis.

- Conducted risk assessments on key financial statements line items and supported walk-through tests on design and operating effectiveness for internal controls over financial reporting (specifically in revenue and commission controls) independently.
- Investigated reasons on significant cash flow changes; tested impairment of assets and verified the rationality and fairness by recalculation and cross interview.

**Bank of China, Xiangjiang New Area Branch**

07/2021 – 08/2021

*Business Banking Relationship Manager Intern*

*Changsha, China*

- Involved in auditing project for Longxiang Group and crawled data from QCC and other websites to identify reasons for loan.
- Performed analysis on allowance of account receivables to assess company's overall operations and loan repayment ability.
- Interpreted financial and cash flow statements to assess and analyze financial conditions of companies and industry trends.

**PROJECT**

---

**AI-Assisted MRI Classification for Insurance Decision Support**

- Designed and evaluated a deep learning pipeline to classify 7,021 brain MRI images into 4 tumor categories (glioma, meningioma, pituitary, none), targeting insurance claims triage and medical-review prioritization as the business use case.
- Built a baseline CNN (Adam optimizer, categorical cross-entropy) and a fine-tuned EfficientNetB0 transfer learning model with two-phase training (frozen backbone → selective unfreezing); applied data augmentation, dropout, batch normalization, and early stopping to control overfitting.
- Improved overall accuracy from 70% → 85%, with the largest gains on hard classes (glioma recall 0.52→0.75, meningioma recall 0.40→0.73; AUC 0.79→0.95); recommended the model as governed decision support with clinician review, not automated coverage decisions.
